OUTLINES

Currently, smart cities are a sustainable urban development approach. Smart cities use ICT (Information and Communication Technology) and IoT (Internet of Things) to connect city functions and services with citizens to solve various problems and improve the quality of life. However, many people do not know what is being done to achieve a smart city. Therefore, this presentation will introduce the status of smart city promotion in Korea, starting with U-CITY in 2000, and the efforts being made by Kyushu University to build a smart city, and provide an opportunity to learn what a smart city is in concrete terms.
